TO THE

READER.

Courteous Reader.

N the following Treatile, you have the (long Promised) Calculation of the Hours, and Parts of an Hour from the Meribian, in all Deelining Di d' for the Latitude of 51 : 30 from one Deree of Declination to 60; and from thence to Digrees, you have an Excellent way of De-

heateing Sun Dials by the Sector.

1 Prefume The Learned and Ingenious Dilifts have approved of thole Tables that I have ready Calculated in my Art of Shadows, of the Hours, and Parts of an Hour from the abstile,) by the quick Sale of two Impressions. nd I may without offence affure the Lovers Art, that thefe Tables are much Easier, they ving had the Approbation of feveral Diallitis d Mathen aticians And to comply with the fire of feveral of my Friends and Acquaintance have .. Published them in the following Pages.

Likewise you have an Arithmetical way of Calculateing all manner of Upright Sun-Dials. either Direct or Declining, in any Latitude,

and to any Declination.

Alfo you have a Dew Method of Deferib ing Dials upon all the aforefaid plains, by that Unparallel'd Infrument the Sector. And by it how to find the Necessary Requisites in Dialling. And I would have you Observe, that a Sector Proper for this Work, ought to be of no less Length than one Foot; because the Lines of Chords, Sines, Tangents, and Secants are divided (if lets than a Foot) but to every 30 minutes, whereas those of a Foot long, are divided into 15 minutes, and than you may Eafily Estimate every 5 minutes;

I shall say no more in Commendation of this Tract, but leave it to speak for it felf, I zemain a well wither to the Mathematicks &c.

JOHN GOOD.

IALLING is an Art teaching how to Measure the time of the Day, by the shade of the SUN; and is Originally a Mathematical Science, attained by the Philosophical contemplation of the motion of the Sun, the motion of the shadow, the Constitution of the Sphere, the Situation of Plains, and the consideration of Lines.

The motion of the Sun is regular, it moving equal Space in equal Time; but the motion of the shadow irregular in all Pars of the Earth, uncleis under the two Poles, and that more or less according to the Constitution of the Sphere and the Situation of the Plain.

And therefore by Art there is found out Rules to mark out the irregular Motion of the Shadow in all Latitudes, and on all Plains to comply with the reguler Motion of the Sun. And their Rules of adjusting the Motion of the Shadow to the Motion of the Shadow to the Motion of the Sun properly be called

The Art of S H A. D. O. W San

A Dial Plain, is a plain superficies, upon which Hour lines are drawn in all. Latitude, and is distinguished in respect of the Horizon, into Parallel (as the Horizontal,) Perpendicular

Building, which are of two forts viz. either Diversion Face one of the four Cardinal points of the Horizon; or Declining, and these are often called Mural Dials. Oblique Plains, are such as Recline, and are either Direct, or Declining.

Geometrical Problems.

B, and with the other describe the Arch D, then aw the Line CD so that it may only touch the own, be Parallel to AB, and at the distance quired.

Problem III. Figure III.

e Latitude of the Place, the Deckination of the Sun, and the Aticule of the Sun being given, to find the Azimuth Geometrically.

The Lati, of the place is \(5 \); 30\\ The Decli, of the Sun is \(\) 20 \(\) North. The Alti, of the Sun is \(\) 18 \(\)

I. Upon the Center Quescribe the Semicircle
ZO for half the Meridian, and upon Quraife
Perpendicular QZ, for the zenith.

Set 51 deg. 30 min. of your Line of Chords, nic 1 is the Latitude of London, fro n Z to AE, d draw Æ Q for the Equinoctial.

3. Set 20 deg. 9 min. the Sun'a Declination, in Æ towards Z, to the Point D, (being it is orth) and draw the Line DT parallel to Æ Q, is DBT the Parallel of the Sun's Declination.

4.

Set 13 deg. 2 min the Sun's Altitude give from U to L and from H to M, and graw of Line ML for the Parallel of Altitude.

5. Take in our Compattes, half the lengt of the Parallel of Altitude SL, or SM; and we that Distance upon Q, describe the innermous micircle ACG.

6. From the Point B, which is where the Parallel of Declination, and the Parallel of Altum do interfect, erect the Perpendiculer BC, tall touch the innermost Semicircle.

7. Lay a Ruler from Q to C, and it will a the outermost Circle in E; so HE measured up a Line of Chords will be 80 deg the Sun's A muth from the North part of the Meridian.

8. E Z that be 10 deg. the Azimuth from East or West.

9. Lastly, EO shall 100 deg. the Azimi

Note, There is throughout this Book and tinual mention made of Degrees and Minute know, that a Degree is the 360th part of a Circle, each of which Degrees is supposed be divided into 60 Parts called Minutes, for 45 Min. is three quarters of a Degree, 30 Min. and 15 Min. one quarter to Degree, &c.

How to draw a Meridian-line on an Horizontal

He best time to find a Meridian-line, will be at such a time as the Sun is between the East and the South, or between the South and the West. Therefore make use of any time between 8, and 11 in the morning, or between 1, and 4 in the asternoon. In the Winter, in this Latitude the Sun Riteth not till 13 min. past 8; at which time from 9 to 11, and from 1 to 3.

With 60 deg. of your Line of Chords describe the Circle ABCD, then (turning your face to the Sun) holding up a thread and plumn et between your Plane and the Sun, fo as the shadow of the thread may pass through the Centre O, I draw the line Sha dow; at which time it was 40 min. palt 10 in the morning, on April the 14th. the Altitude of the Sun being 48:13 and his Declination as you may fee by the Table in page 6) 13:07, the Latitude 51:30, then by the lait Problem get the bun's Azimuth, which will be 30 dgrees; then becaute your Observati. on of your Shadow-line was in the morning, let 30 degrees the Sun's Azimuth, from that end of the shadow-line marked with Sha, towards the Right-hand, as to B, and draw the line BOD for the Meridian-line. But it your Observation be in an Afternoon, the Azimuth must be fet towards the Left-hand.

the Radius or Sine 50 degrees 10 000000 the Sine of the Latitude 51 30 9. 893544 is the Tangeur of 15 degrees 9. 428053 the Tangent of 11 deg. 50 min 19 321 96

Which II so is the distance of the first hour m the Meridian namely xi and I. Work after the same manner with the Tangent

of the hours.

Now

Now if you dign to put into this Dial, or any of the rest that follow, the half Hours and Quarters, their distances upon the Plane are as easily sound by the same Rules, as the Hours were, for by adding the Log. Sine of the height of the Pole, or Stle unto the Log. Tangent of 3. deg. 45 min. 7 deg 30 min. and 11 deg 15 min. which are the Equinoctial distances of half hours and quarters, there will come so the Log. Tangents of new distances, proper to the halfs and quarters.

Thus you have all the hours-lines; but for the Drawing of it take the directions following.

Take with your Compasses 60 deg. from a line of Chords, and the same Extent, setting one Foot in the Centre A, with the other describe the Circle D O E, which done, take from the same Scale of Chords, all the Hour-distances, and placing one soot of your Compasses in O. (where the Circle Intersects the Meridian) with the other set out the Hour distances before sound by Calculation, both ways upon the Circle D O E, then drawing streight Lines from the Center A, to those Points in the Circle, you shall have the true hour lines desired.

Pole's

Pole's Elevation 51 deg. 30 min. and set from O to P, drawing the line APH, for the Stile; so will NAH be the true pattern of the Stile, or Gnomon of your Dial, which erect at right Angles over the 12 a Clock Line, and so your Dial is finished.

CHAP. II.

How to draw an Horizontal Dial by the SECTOR.

IRST, draw the Line CAB, for the Hour-Line of 12, and cross it with the Perpendicular DAE, for the Hour-Line of 6, A being the Center of your

Dials then in proportion to your Plain determine AB, to be Radius, that is, take in your Compasses the length of the Line AB, setting one foot in 45 deg. of your greater Tangent on your Sector, open the other Leg of your Sector untill the other toot of your Compasses salls on 45; then take out the Sine of the Latitude (of the place, for which your Horizontal Dial is made for which let it be 51 deg. 30 min.) to the same Radius, and set from A to D, and E then setting one foot in B, with the same extent sweep the touch

· Sinte

of the Radius AB, and setting one foot in D weep the touch of an Arch at I, Intersecting the former, also setting your Compasses in E, make helike at G, and through the Points of Intersection, draw the streight lines EG. Dl. and GBl, and they will make a right angled Parallellogram, the sides whereof will be Tangent lines.

Co braw the Bour-Lines.

Make BG, or Bl Radius, that is, take with your Compasses the length of BG, or BI, setting one soot in 45 of your greater Tangent, even the other I eg of your Sector till the other fact salls in 45 deg. (this I call a Parallel distance then take the Parallel distance of 15 deg. and set from & towards G and I, for the hours so 11 and 1, and the Parallel distance of the Tangent of 30 deg and set from B towards G and I, for the hours of 10 and 2, and draw lines through the Points G and I, and there will be 3 hours drawn on each side the Meridian-Line.

Again. make DI or FG Badius, and take out the Parallel distance of the Tangent of 15 deg and prick down from F to 5, and from D to 7; then take the Parallel distance of the Tangent of 30 deg. and set it from F to 4, and from D to 8, and draw lines into the Center, and so the Lour line

Work after the fame manner with the Tanent of 30 deg. 45 deg. 60 deg. 75 deg. for the eft of the Hours.

The distance of each hour - line from 12 a Clock being tound, you must Project them into the Dial after the same manner as was shewed in the Horizontal Dial, only for the height of the Stile

you must take the complement of the Latitude of the Place, 38 d. o min and then work as before, only draw act the hours of 4, and 5, in morning, nor 7, and 8 at Night. Observe Figure B.

How to draw a South Dial by the SECTOR.

Having drawn A. B. the Meridian, and croffed it with the Perpendicular D. A. E, for the hour line of 6, dertermining A. B., Radius, of any length, take out the Sine of 38:30, the Complement of the Lat. to the same Radius, and set it from A, to E, and D, then you may fin the your Dial as you did the Horizontal, making B. G., B. I., E. G., and D. I.; Radius, and your Stile must make an Angle of 38:30.

CHAP. IV.

hour-lines are finished, and for those that fill a bove the 6 of the clock line, are drawn by extending the two opposite hour-lines thro' the Common as 4 in the morning is drawn by extending 4 in the Asternoon, &c.

dian equal to the Latitude of the place, which is example is 51 deg. 30 min. and must fin at Right Angles with the Plain upon the 11

Clock Hour-line.

CHAP. III. Fig. B.

To describe the Erect South Dial, whose Plands upright, and directly beholds the South

the Horizontal, only in the Calculate part, you took the Poles Elevation, but here you take the Complement, and infert only I hour as will appear by the figure.

Let the Question be to Calculate the distant of 11, or 1, a Clock from the Meridian; in the

Latitude of 51 deg. 30 min.

The Canon for Calculation is.

As the Radius 90 degrees 10 00000

Is to the Coline of the Lat. 51:30 9.79414

So is the Tangent of 15 degrees 9.4:805

To the Tangent of 9: 28 19.22220

Which 9: 28 min. is the distance of the man bour from the Meridian, namely 11, and 1.

How to draw a Direct North Dial.

Direct North Dial, is the fame with the South Dial; for if you take a South Dial and turu it uptide down, caufing the Stile point upwards, as the Stile of the South doth wnwards, and leaving out the Hours near the feridian, in these Northern Latitudes: as the lours of 9, 10, 11, and 12, at night, and 1, and 3, in the Morning, all which time the un is under the Horizon . I say a South Dial for verted, and fixed against a direct North Wall, all give the true hour of Day.

CHAP. V. CHAP. Fig. 6.

ow to draw Hour-Lines upon a direct East or West Dial, Arithmetically. oz ofer Parision 7 & Clock

ET there be an East Dial, whose breadth is of Inches; and it is required to put on all the our lines from 6 in the Morning till at at Noons! ere you have 5 hours and 6 Inches. Therefore efore you can work the Operation, you must turn

turn the hours into Degrees, by allowing for every hour 15 degrees, so you have 75 degrees to 5 hours; then turn the Inches into Parts, by allowing 100 Parts to every Inch, so you will have 600 Parts.

T

1. For the height of the Stile.

As the Radius 90 degrees

Is to the Co-Tan. of 5 hours 75 deg. 9.4280
So is the Log. of the diff. from 6, 600 2.7781
To the Log. of the Stiles height 161 12.2061

That is 1 Inch, 6 t parts of an Inch, an Ind divided into 100 Parts.

11. For the Hour-Lines distance from 6.

The Canon for Calculation is,

As the Radius 90 degrees 10.00000

Is to the Log. of the Stiles height 161 2.2068

So is the Tangent of 15 degrees 9.42800

To the Log. of 43 Parts for 72 Clock 11.6340

As the Radius 90 degrees. 10 90000 Is to the Log. of the Sales height 161 2.2060 So is the Tangent of 30 degrees 9 7614

ET dure be an Edh Maktwackabrendel

To the Log. of 93 Parts for 8 a Clock 1 1.9681

19) As the Radius 90 degree; 10.00000 Is to the Log. of the Stiles height 161 2.20682 S) is the Tangent of 45 degrees 10.00000 To the Log. of 161 P. for 9 2 Clock 12 2068 2 As the Ridius go degrees. s to the Log of the Stiles height 161 2 20683 So is the Tangent of 60 degrees 10.23856 To the Log. of, 279 P. for 10 a Clock 12.44539 As the Radius 90 degree. s to the Log. of the Stiles height, 151 2.20683 o is the Tangent 75 degrees, To the Log. of 600, P. for 11 a Clock 12.77877 Having thus fir proceeded, was 5 Hour from is Calculated, namely, 7, 8, 9, 10, 11, there repet 4 and 5 in the Morning that must be rawn the fame diftance from 6 in the Morning, 57 and 8 are; therefore, for your better Instrucons, fee Figure 6, and imitate this Geometrial Confuction.

CHAP: VI.

How to Place an Upright Dial truly.

A LL Upright Dials, in what Latitude for ver, have the Meridian perpendicular to the Horizon, I herefore to let your Dial exact, hang a Linewith a Plummet at the end thereof, upon a nail tint in the hour-line of 12 towards the top; then apply your Dial to the clace where it is to be fixt, to that the line and clummer may hang just down upon the line of 12. The Dial thus has (if the Declination be truly aken, and the Bial made by the former directions) will at all times (if the Sun's on it) give the true hour of the day.

Note, In every Dial cruly placed, if you fland on the South-fide of the Plane locking Northward, the hours on your left-hand of the Medician, are the Morning hours, on your right-hand it the Evening hours; but it you fland on the North-fide of the Plain, your Face being Southward, then the Forencon hours are on your right-hand, and the Afternoon-hours on your left; eccuse your right hand, in estation to the Plain,

where your left-handwas.

CHAP.

CHAP, VII.

How to find the Declination of any Plain, from the South or North, towards the East or West.

The Declination of a Plain is an Archel the Horizon comprehended between the Pole of the Plane and the Meridian of the Plane. Or it is the distance of the Plane it selfc, from the prime Vertical Circle, or Azimuth of East and West.

To find out the Declination of any Plan, there are required two Observations to be made by the Sun at the same instant of time. The find of the Sun's Horizontal distance from the Pole of the Plane, and Secondly, of the Altitude of the Sun.

First, to find the Sun's Horizontal Different from the Polests, the Plane. Apply one edges a Quadrant, to to the Horizontal Line of your Plane, so that the other may be Perpendicular to it, and the limb of the Quadrant towards the Sun and hold the whole Quadrant Horizontal as not as you can competure: Then holding up a Three and Plummet, at full Liberty, so that the Shador of the Thread may pass both thro' the Center and

nd Limb of the of the Quadrant, observe then the Degrees cut by the Shadow of the Thread, and number them from that side of Quadrant that sandeth square or Perpendicular to the Plane or those Degrees are the Horizontal Listance quired.

Secondly, This Horizontal distance and the in's Alutude being observed at the same time is near as may be) will help you to the Planes

clination in this manner.

When you make your Observation, of the n's Horizontal Distance, mark whether the adow of the Thread, sall between the South, I that side of the Quadrant which is Perpenular to the Plane.

I. If the Shadow fall between them, the Azith and Distance. Added together do make the clination of the Plane, and in this Cale the clination is upon the same Coast whereon the

i's Azimuth is.

e tut

Pole

II. If the Shadow fall not betwen them, subcet the lesser of them from the greater, and the nainder shall be the Plane's Declination; and he Azimuth be the greater of the two, the ne Declines to the same Coast whereon, the is; but if the Distance be the greater, then Plane Declines to the contrary Coast.

And here Note, that the Declination thus

found

found is always accounted from the South, and that all Declinations are accounted from the South or North, towards either East or Well, and must never exceed 90 Degrees.

I. If the Degrees of Declination do exceed 90, you must take the residue of that Number to \$80, and that shall be the Plane's Declination from

the North

Il. If the Degrees of Declination exceed 180 degrees, then the excels above 180 degrees gives the Plane's Declination from the North towards the Coast, which is contrary to the Coast whereon the Sun is.

But feeing the Declination is the Angle contained between the Perpendicular from the Wall and the Meridian, it may be best to wait in fair Weather, till you find the Sun in the Meridian; and then the Angle upon the Limb of the Quadrant, will it sell be the Declination.

CHAP. VIII.

To draw the DIAL.

Raw the line BMALC, for the 'Iorizontal line of the Plain, and Per pendicular thereunto, from the point A draw the line A H for the Meridian line, and with 60 Degrees of Chords draw the Pickt Arch Q C, then from Q towards the right hand because the Plain Declines West, set to R 62: 3 min. the Angle of 12 and 6 o' the Clock, and draw the line R A, for the laid Hour-line, then open your Sector (according to the bignels of your Plain) making A H, equal to the bine of 65 des the Complement of the Decitnation, and A L, and A M the Sine of 38 d. 30 min, the Complement of the Latitude. And draw L G, and M E, parallel to A H. Then take the diffance A H, and fet from D, (the point where the hour line of 6, cu teth the line LG.) to G, and draw the line GHE, then fet the extent D G, on the line E M, upwaids) from E, to X, and continue the line E M, to X. Make HG, or HE, a Radius on the greater Tangent; and lay from H towards E and G. the langent of is deg and 30 deg. for the Hours 10, 11, 1, 2. Also make DG, or X E. Radius on the line of Tangent, and let from X,

:01

and D, rowards E and G, 15 deg. 30 deg. for the Hours of 7, 8, in the Morning, and 4, 5, in Afternoon, And lines drawn from A to thele feveral Divisions, and also to the Angles E and G, and you have the Hour lines required. Those hour-points that fall above the Horizontal line, must be drawn thro' the Center to supply what is wanting on the other side of the Meridian as in this Crample. 7 in the Morning drawn thro' the Center makes 7 in the Evening &c.

So you have below the horizontal line of the Plain, 8, 9, 10, 11, 12, 1, 2, 3, 4, 5, 6, and 7

If you defire the Quarters, half hours, and three quarters this little Table will direct you by ferring off the Tangents upon every line you make Radius.

Note, I. From Q to S (in the pricked Arch) let 18 deg. 33 min. and draw the line A S, for the Substile.

2. bet from S, to O, 34 deg. 21 min. and draw the line A O, for the Stile, which must stand perpendicular upon the line A S, and your Dial is finished.

3. In the Geometrical Construction of this Dial in the last Chapter, the hour line of 8

4. Set your Stile Perpendicular on the Substile A 5, making an Angle of 34: 21, represented in figure 7, by the Triangle S A O, and your Dial is finished.

5. In the making of this you have made a South Dial declining 25 deg. Eastward, as you may see in page 31.

CHAP. X. died fig. 9.

How to Calculate and draw Hour-lines upon 2 South or North Dial Declining East 81 deg. in the Latitude of 51:30.

Coording to the Method I shall here take, the stile may be so Proportioned, by the Descretion of the Artist, as to fill the Plane of Inspection with Convenient hour lines.

Be ore the Dial can be drawn, observe the diections of the viii Chapter, in finding the Subles distance, the Stiles height, and the Planes of there of Longitude, and makeing a Table of there taught.

Thele

The things being done, draw a Perpendicular I ne upon the Plane, as AB, and with 60 dege. of Chords, fetting one foot in A, describe the Arch CD; then take in your Compasses (from the Scale of Chords) 38: 09, the Substile's d stinee, and fet it from C to R, and draw the prickt line AR for the Substile; this done, Take from the Scale of Chords, 05: 53, the Stile's height, and let it from the Subtile, where it interlects the Circle, as from R to S, and draw the line A 5 for the Stile, then confider the bigness of your Plane, so as you may Augment the Stil; that the Hour-lines may fill the Plane, which in this Diai I shall raise 9 Inches, (or 750 Parts of a foot the foot being divided into a 1000 equal Parts,) as the line ET, parallel to the line SO, so will the Stile be augmented; then make coice of two Points in the Substile; as at F and G, and draw the two Contingent lines, as M M and KK at right Angles with the Substile; then measure the neight of your augmented Stile in equal parts as from G to E, which I find to be 14 Inches or 1165 equal parts, and from F to T 11 Inches, or 915 equal parts, which two numbers are to be made use of in the Calculation of the several hour distances, by this Analogy. As the Radius 90 degrees, is to the Logarithm of the Stile's height in Parts, (in either of the Contingent Lines,) fo the Tangent of the Angle at the Pole, to the Logarithm in equal parts for that hour-distance

from the Substile, and so for the distance in Parts, in the other Contingent line for the same hour, as shall here be demonstrated in the 6 a Clock Line, it being the first line on the upper side of the Substile, whose Angle at the Pole is (as you may see by the following Table) o7 deg. 04 min.

148

12 W

, E

25 W

OE!

SOE

T is easie to Infert the Meridians of nade for any Place; if first you know the Difference of Longitude between he two Countries in Time, and also whether he Remore Country lie Eastward or Westward: rom the Home Country : For if the Remote Country lie Eastward of the Home Country, it s Noon forner than it is at the Place the Dial ich fiand in ; if it lie Weltward, then later.

As for Crample.

Suppose that in a Sun Dial at Mondon, you would Infert the Meridian or Noon-tide of Bar adoes, which by the best Geographers lies Westward of London 58 degrees 15 min. which onverted into Time, by allowing for every hour 5 Degrees, and for every odd degree 4 min. 2 W makes 3 Hours 53 min. Wherefore if you add hours 53 min. to 12 a clock at L indon, it nakes a hours 53 min. patt Noon. Therefore f upon a Sun Dial at London, you write, the yord Barbabous, upon 52 min. past 3, (or take this * ,) the shadow of the Stile of the Dial, when it shall fall upon the mark you nay conclude it to be Noon at Barbadous; and is Took of banding mentioned in the Tal knowing that, it is easiely known what hour it is at any time of the Day; For it you lav a Rule from the Center of your Dial to 52 min. past 04 at London it gives you the point for one of the Clock in the Asternoon, and to 52 min. past 5 in the asternoon at Monton it gives you the Hour-point of 2 a Clock in the asternoon at Bar badoes, and so proceed round the Dial to lay the Rule to 52 min. past every Hour &c. and the same Shadow that shews the Hour at London, in its Passage over the other hour-points gives the true Time at Barbadoes.

Note. The best sort of Dials to Insert the Disserance of Meridians upon, are the Polar Dial, and the Horizontal, because the Sun shineth on those Plains, from his Rising to his Setting.

H Dial

of I

and Sect

20 B

part

Cor

5269

0! I

And if you Insert the Meridian of Barbadoes on either of those Dials, the Mid-night Meridian will fall on 52 min. past 4 in the Morning, and it is be the best way to make the hour line and figure of another Couler, or Sort, that you may know it from the Noon Meridian.

You may be these Tables (or any other that hath the Difference of Meridians in Time) find the hour at any Place assigned, without having it Inserhed upon a Dial, by substracting the difference of meridians from the Time at London, if the Place be West from London, or adding if it be East, and by having the Time of any Eclipse, or New or Full Moon, Sec. at London, may know the hour and minitis at any other place mentioned in the Tables

DIALLING,

Performed by the SECTOR.

THE CALL BOOK OF THE WAY OF THE PROPERTY OF

How to draw Hour-lines upon an Horizontal Dial with twice opening the Compasses. (Fig. A)

hour line of 6. And perpendicular there hour line of 6. And perpendicular there unto the line A O B, for the hour line of 12; take any convenient distance as A B, and make it a parellel Sine of 90 deg. on your Sector. Then lay the Sine of the Latitude 51 d. 30 min. from A to D and E, and draw the line E D, and B E, and divide them into two equal parts as at O. Then make O B, or O D a Parallel Radius, that is take the given line in your Compasses letting one foot in 45 deg. of the greater Tangent, and open the Sector till the other Foot talls on 45, then take the Tangent of 15 deg. 30 deg. and lay from O towards B

and

and D, and from O towards B and E, and you have the hour points of 7, 8, 9, 10, 11, in the morning, and 1,2, 3,4, and 5 in the afternoon, the points O, being the Hour points of 9 in the Morning, and 3 in the Afternoon Laftly, from A, the Center thro' the c points draw lines, and they will be the hour liner. The Stile meet, the Plain in A, and standing over the Meridian A 12, makes an Angle withit of 51 deg. 30 min. The Hours 4, 5, before 6 in the morning and 7 and 8 after 6 in the evening, are drawn by continuing their opposite hour lines 4, 5, in the afternoon, and 7, 8, in the forenoon, beyond the Center. In like manner may a Direct South or North Dial be drawn, omitting those hourlines that would be useless, and instead of the Latitude, let the Complement (38: 30) from A, to E, and D, in figure B.

SECTION VII.

Of Declining Dials.

Lelining 25 deg. Westward, in the Latitude of 51 deg. 30 min.

IN order to this, there are four Things necessary, which may very readily be obtained by the Sector, in the sollowing manner.

The Use of the TABLES

SECTION I.

The Geometrical Construction of a South Fast and South Weft Plain, Declining 25 Des.

Fift, draw the Horizontal Line A B. (as in ig. D & E)and from the middle of the line A B at fall the Perpendicular C D, for the Meridinor Hour line of 12. Then with 60 Deg. of Chords, making C the Center, describe with your Compasses the Semicircle A E B.

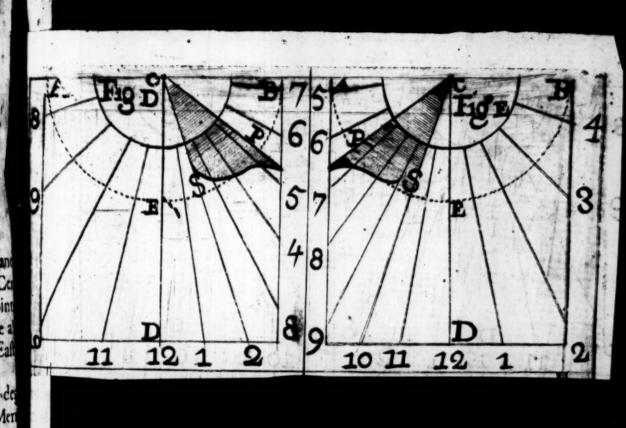

Then turn to Page 24 of the Tables, in it you'l and South Declining 25 Deg. Then from the fame line of Chords you described your Smicircle with, work as followeth: Take off 73 deg. 10 min. which stands against viti and itil, the first Hours in your Table, and set from the Meridian line on your Semicircle from E towards A, in the West Decliner, and from E towards B, in the East Decliner for the Hours of vii in the Morning in the West Decliner, and iiii in 36 the Afternoon on the East Decliner. Then take 47 deg. 12 min. for ix in the West decliner, and iii in the East decliner; & 11 deg 30 min. or xi in the West decliner, and i, on the East decliner, so youhave the Hour-Points for the Morning Morning in the West decliner, and the Aster

| | D. | 35 | from E to | 2 | And from E towards |
|-----------|----------------|----------------|---|------------|--------------------------------------|
| Then take | 36 47 62 | 08 24 05 | wards B, on the W. Decliner, for the H | 4 5 6 | Hour-Poi, on the Ea. Decliner, |
| | 82 | OI. | Points of | ~ Afternoo | VIZ. |

Thus you have Hour-Points for the Eastand West Decliner. Then lay a Ruler to C the Co tre of each Dial, and through the respective point made in the Semicircle, draw lines, you have a the Hour-Lines of South Plain Declining East

and West 25 Degrees.

Lastly take from your line of Chords, 18 do 37 min. the Substile's dittance from the Men dian, and set on the Semicircle from E to S, o both Dials, and draw the line C S, for the substile, and take 34 deg. 21 min. and set from S to P, for the Siles Height, and draw C P, and you have the Stile, which may be either a Plat or Wire brought to such an Angle, and must stand Perpendicular to the Plain, and directly ver the Substilar C S.

Thus you have fiinished your Dials: If you defire to insert the Quarters, Half Hours, and Three Quarters, on the Dial, take them from the Tabic, and set them on your Dial from the Meridian by the same line of Chords you made use of for the Hours and you'l have your dire.

Note. If the Declination be East, the Substile must be placed on the lest side of the Meridian, and those Hours that are next to the deg. and into. in your Table must be used: but the contrary if your Plains Declination be West.

Now you have finished your Dials and in so doing you have made two North Decliners, as you may see by Page 31 before the Tables.

And in the same Page, you have directions for finding the time the Sun for laketh one side of a declining Plain to shine upon the other.

How to draw the hour lines on Far Declining Dials is Taught in Page 37 before the Tables

Advice to Diallifts.

T is Usual among Dialliss, when they draw Dials upon a Cube, to draw South and North Decliners instead of the Four Erect Dials: And to draw the Hour-lines of the Morning on the South-west decliner, and the Asternoon Hours on the South-East decliner; and the hours before bun rising, and after Sun setting on the North Decliners

decli er, which Hours are needless; but if the like the Decliners better than the Erect Disk it is better to leave out the Morning Hours of the South West decliner, and the Asternoo hours on the South East decliner; because the Forenoon hours on the South East decliner, and the Asteenoon on the South West decliner, she all the hours from Sun-rising till Sun-setting

When I draw the Decliners upon a Cube, place the Meridian of the South West decline near the Lest side of the Plain, and the Meridian of the South West decliner near the Right side, by which means the hour lines will be a ther from one another. And the Midnig Meridian of the North West decliner near the Right side of the Plain, and the Meridian of the North East-near the Lest side.

Thus haveing given you the Use of the Tables in the drawing a Dial Declining 25 grees, I think it needless to give any me Examples of other Declinations: For let y Declination be what it will under 60 deg is but turning to it in the TABLES, and ing the degrees and minutes belonging to the Hours, show the Meridian, and drawing lift from the Centre, and you have your defire

SECTION III MALE AND ALL

ow to find the Declination of any Plain is raught in CHAP the VIII th. It being the Common way given by many Authors; but the way that I use is as followether in the same to show that I use is as followether in the same to show the same to same the same the same the same to same the same to same the same that the same that the same to same the same the same than the same that the

ET a large square piece of Brass or Wood. and draw on it a Circle, which divide into ur parts, perpendicular to each fide of the Iquare en let one half of the Circle be divided into 180 ez. and numbred with 10, 120, 30, 40 30, 60 , 80, and 90, each way from the Perpendicu-; on the Centre of the Semicircle moves an orizontal Dial, properly made for the Latitude the Place, and which bath a small bit of hine als fix'd on its Metidian Line, like a fiducial ige, to cut the Degrees in the Semicircle he use of which is very easy; for at any time sen the Sun thines, you need only apply that e of the square to the Plain where the Degrees gin to to be Number'd from, and then ferting as nearly as you can Horozontally, tom the al abour, till it thews exactly the true Hour of Day, (which before must be rightly found, nd a Watch fee to it) and then will the Fiducial edge cut the Deg of the Plains Declination; nd which way to account it, will be eatily feen, scause the Dial pointing true North, gives ou an Idea of all the Points of the Compals. And See fig. F.

And this Method will be of great use to such whose Bosiness it is to make many Dials in or near the same Latitude.

To place an Horizontal Dial, made for the La tilude of Loudon (51:30) in any other Latitude, has to them the true Hour of the Dav, as well as the it was made the Latitude placed in.

F you live in London, and have an Hori zontal Dial made for that Latitude, and you remov your Dial to another place that lieth more Northwad, or Southward, Eastward or Weitward maketh no alteration) you must not place your Dial Horizontally as before out Observe these Rules following.

RULE I.

Suppose you Remove your Dial Northward that is to a greater Latitude, Admit, to New-cattle upon 1 ine, whole Latitude is 54: 58, Subjurant the one from the other, and note the Difference.

The DEMONSTRATION of these two RULES.

Observed in Newcastle upon Tine, a
Sun Dial, whose North side was Eleva
ted above the Horizon o3 deg. 28 minthe owner told me it was an Horizontal

the owner told me it was an Horizontal al made for some other Laritude, Viz. Lonn, and was so placed by a Diallist as to shew true time of the day.

He defired me to Prove by the Rules of Dial sthat it was made for London, which I did olloweth.

Complement is 35 deg. 02 min. the Plains
Reclination

Reclination in that Latitude is the Complant of its Elevation above the Horizon, viz. 86 32 min. and is a Direct South Recliner, are than the Complement the Latitude, which the first Sect. of the XI the Chap. in Page before the Tables, is thus Broved.

Example.

Complement of the Lat. 35 : 02

Remains the Lat. requ. 51 : 30

Again, admit you are at Paris in Franch fide on deg. 31 min. In what Land is it an Herizontal Dial?

The Latitude of Patis is 48 deg. 39 me the Complement is 41 deg. 21 min the Renation in that Latitude is the Complement its Elevation above the Horizon viz. 87 and it is a Direct North Dial Reclining greathan the Complement of the Latitude, when the Complement of the Latitude, when the Latitude is the Complement of the Latitude, when the Complement of the Complement of the Complement of the Complement of the Latitude, when the Complement of the Comp
